CyberSecurity Must-Do Checklist For Businesses

CYBERSECURITY FOR BUSINESSES

Implementing and maintaining effective cybersecurity measures can be a daunting task, so start with the basics. **Here are 8 things every business needs to do to stay protected.**

☐   1.   Secure your office's internet with a firewall. If your office is wireless, make sure your connection is hidden to outside users and password protected.

☐   2.   Ensure there is an active antivirus software program installed on all systems.

☐   3.   Educate all employees about cyberthreats and how to avoid causing unintentional harm to your business.

☐   4.   Set stringent requirements for employee passwords, and change them on a regular basis.

☐   5.   Establish protocols for accessing and transmitting sensitive data.

☐   6.   Put in place a backup system and disaster recovery plan for ALL files and data so that if your network or system becomes compromised, a copy of your files still exists.

☐   7.   Limit access to programs and data by ensuring that employee devices such as laptops, tablets, or mobile phones are password protected in case a device is stolen or misplaced.

☐   8.   Ensure your business' public website has adequate security to protect both your business and your clients from hackers and other cyberthreats.
